wav files, so you can move them easily to other DAWs. The package contains all the drum samples you need. The kit contains ten drum samples: The kick drum is represented by a booming kick drum and a snare drum. The snare is then replicated by a cymbal and another snare drum. The hi-hat is a crash cymbal, the brushes are mallets, and the ride cymbal is a crash cymbal with a clatter. The tom-toms are two open-horns (one of them is metallic), a closed-horns (which is organic), a kick tom, and a closed-horns (which is wooden). The rack and the toms are also represented by two mallets (one with a clatter) and one open-horns (metal) and a closed-horns (wooden). The MIDI sequences contain all the drum events that are needed to set up the kit. For the ten samples in the package, you can set up a kit in your DAW, so you can put them in a track and mix them. For this kit, you don't need to tune the drums to a regular tuning. The sounds were recorded at 44.1/16 kHz with 24 bit resolution, so they

sound very clear. The power of the kit is controlled by the initial parameter of every sample: The kick is a very dynamic drum sample, the snares are big drum kits, the crashes are big crashes, and so on. The complexity of the samples is controlled by the duration parameter: The longer the sample, the more complex and the more dynamic it will sound. All the samples in the package have been mastered with Xpand!e on the Universal Drums module. Certain of these devices are adapted to detect two-dimensional locations on the surface over which the input device is moved. Some input devices are equipped with digitizers, for instance, that detect three-dimensional locations on the surface over which the input device is moved. Other input devices are equipped with non-digitizers, for instance, such as keys or buttons, for example, that detect two-dimensional locations. Some such input devices 82157476af
